

April 23, 1943

FARM PRODUCTION, FARM DISPOSITION, AND VALUE OF PRINCIPAL CROPS,
 1941-1942

Farm disposition and sales of principal cash crops at the season average prices are shown in this report by States. The estimates of production are the same as published in the 1942 Annual Summary of Crop Production, except for fruit in a few instances where footnotes indicate a revision since that time. The estimates of farm disposition relate to the portion of the crop used or to be used for the designated purpose. Estimates of disposition and sales are for the crop year, which varies for the different crops as indicated in the note at the bottom of each table. Disposition also relates to disposition on the farm where produced. For example, corn "used for feed and seed" does not include purchased corn, and corn shown as "sold" from farms may later be used for feed or seed on other farms in the same State or in another State.

The season average prices for the 1941 crops represent, in most cases, the estimated prices as of the 15th of each month, weighted by the estimated quantity sold in each month of the crop marketing season. The prices for the 1942 crops are based on estimated prices for the 15th of each month from the beginning of the crop marketing season to March 31. For tobacco, popcorn, broomcorn, sugar beets, sugarcane, maple products, hops, and many of the fruit and nut crops, special season average price inquiries furnish the basic data for each year. For sugarcane sirup (except Louisiana), sorghum sirup and velvet beans, prices are season average prices to December.

The value of sales represents the quantity of the crop sold multiplied by the season average price. This should not be confused with cash income, which relates to the calendar year, irrespective of the year of production. The value of the crop consumed in the farm household represents the quantity so used, multiplied by the season average price. Similarly, in order to arrive at a measure of the over-all importance of each crop in the farm economy, the value of production is obtained by applying the season average price to estimates of total production, or production having value, as the case may be. The figures for cotton and cottonseed will appear in the April 28 Cotton Report.
